

METHOD AND STRUCTURE FOR INTEGRATED CIRCUIT PACKAGE

ABSTRACT OF THE DISCLOSURE

An integrated circuit package is constructed to potential reduce stress and damage to an integrated circuit die. A rigid transition medium (220) is attached using adhesive layers (215, 42) and interfaces between a tape carrier (260) and the integrated circuit die (210). The integrated circuit package prevents damage such as die cracks and also enhances the service life of the packaged integrated circuit part.
